CALCOFI HYDROGRAPHIC DATA REPORT  
MONTEREY BAY  
JANUARY TO DECEMBER 1976

INTRODUCTION

The data contained in this report were obtained as a continuance of the nearly bi-weekly hydrographic observations initiated by personnel at Hopkins Marine Station over two decades ago. These observations have been supported through the years by the State of California Marine Research Committee, California Cooperative Oceanic Fisheries Investigations. Since July 1974 the hydrographic sampling program has been carried out by investigators at Moss Landing Marine Laboratories in conjunction with an interdisciplinary study of the squid, Loligo opalescens, supported by the National Office of Sea Grant via the University of California Sea Grant College Project Number R/F-15.

Five of the original CalCOFI stations (2201, 2202, 2203, 2204, and 2205) have been retained in our sampling routine, and additional inner-bay stations have been added (1125 and 1154). Sampling was conducted bi-weekly from January through June and was on a monthly basis for the remainder of the year. All observations were made aboard R/V Oconostota.

In December an additional deep station was sampled during an International Decade of Ocean Exploration (IDOE) cruise. These data are included at the end of the regular CalCOFI cruise data.

## STATION LOCATIONS

NUMBER	LATITUDE N.	LONGITUDE W.	DEPTH (m)
2201	36°37.6'	121°63.6'	46
2202	36°41.2'	121°57.9'	104
2203	36°46.7'	122°01.2'	988
2204	36°50.9'	122°01.5'	82
2205	36°55.8'	122°00.7'	26
1121	36°37.6'	121°51.2'	18
1154	36°55.2'	121°52.7'	16

Figure 1. CalCOFI hydrographic station positions. 22 prefixes designate stations originated by Hopkins Marine Station.

## EXPLANATION OF TABLES

CRUISE	Moss Landing Marine Laboratories consecutive hydrographic cruise number.
STATION	Permanent hydrographic station numbers. 11xx designates Moss Landing Marine Laboratories numbers, 22xx CalCOFI numbers as originated by Hopkins Marine Station.
DATE	Local date of sampling.
HOUR	Local sampling time (Pacific Standard Time). Time of messenger release is given for one-cast stations, median time on station is given for multi-cast stations. For two-cast stations the time on-station was generally under one hour.
N LATITUDE W LONGITUDE	Observed station positions corresponding to sampling time given above. Drift while on station was generally less than 0.5 miles. When greater drift was experienced, the ship was brought back to the station for subsequent casts.
TRANSP	Secchi disk depth, meters (not observed at night).
WAVES dir	Direction from which the dominant waves were coming, in tens of degrees, according to WMO Code 0885.
ht	Height of dominant waves according to WMO Code 1555.
p	Period of dominant waves according to WMO Code 3155.
WIND dir	Direction from which the wind was blowing, in tens of degrees, according to WMO Code 0877.
speed	Wind speed in knots.
BAROM	Pressure in millibars
AIR TEMP °C	Air temperatures were obtained about 2 m above surface
dry	Dry-bulb air temperature in degrees centigrade.
wet	Wet-bulb air temperature in degrees centigrade.
WEATH	Present weather according to WMO Code 4677.

CLOUDS	
typ	Cloud type according to WMO Code 0500.
amt	Cloud amount in eights according to WMO Code 2700.
VISIB	Sea level visibility according to WMO Code 4300.
DEPTH	Accepted depth in meters from which the sample was obtained, determined from wire length, wire angle and thermometric depth calculation.
TEMP	<u>In situ</u> water temperature in degrees centigrade.
SALINITY	Salinity in grams/kilogram ( $^{\circ}$ /oo or ppt).
SIGMA T	Potential density anomaly, computed from the equations in Knudsen's Hydrographical Tables (1901).
OXYGEN	Dissolved oxygen concentration in ml(STP)/liter.
AOU	Apparent oxygen utilization in $\mu\text{-atoms O}_2$ -O/liter: the difference between the observed oxygen concentration and the oxygen solubility computed from the <u>in situ</u> temperature and salinity using the equations of Truesdale, <u>et al.</u> (1955).
SAT	Per cent of oxygen saturation computed from the <u>in situ</u> temperature and salinity using the equations of Truesdale, <u>et al.</u> (1955).
PHOSPHATE	Concentration of reactive phosphate in $\mu\text{-atoms PO}_4^{-2}\text{-P}$ /liter.
NITRATE	Concentration of dissolved nitrate in $\mu\text{-atoms NO}_3^{-}\text{-N}$ /liter.
NITRITE	Concentration of dissolved nitrite in $\mu\text{-atoms NO}_2^{-}\text{-N}$ /liter.
AMMONIA	Concentration of dissolved ammonia in $\mu\text{-atoms NH}_3\text{-N}$ /liter.
SILICA	Concentration of reactive silica in $\mu\text{-atoms SiO}_2\text{-Si}$ /liter.
*	Questionable data point. These values are suspect based upon preliminary analysis of the data and should be used with caution.

## METHODS

Station Position. Station positions were determined using radar ranges with an accuracy of about  $\pm 0.2$  n mile near shore and  $\pm 0.5$  n mile at station 2203.

Hydrographic Sampling. Eight 5-liter Niskin plastic sampling bottles were used to obtain discrete water samples at the standard sampling depths: 0, 5, 10, 20, 30, 50, 75, 100, 150, 200, 250, 300, 500, 600, and 800 m. Accepted sampling depths were determined from wire angle for depths less than 100 m and from a combination of wire angle and thermometric depth calculations for depths greater than 100 m.

Temperature. The in situ temperature was determined from paired reversing thermometers. The average temperature is recorded when the thermometers agreed to within  $0.05^{\circ}\text{C}$ .

Salinity. Salinity was determined using a Beckman RS-7B precision induction salinometer. Analyses were made in the laboratory and salinity was computed from conductivity ratio using the equations of Cox, et al. (1967). Substandard seawater was used to calibrate the salinometer before and after each set of 24 or fewer samples. Copenhagen water was used each month to standardize the substandard water.

Dissolved Oxygen. Water samples were treated aboard ship to fix the oxygen in the basic form. The samples were acidified and

titrated in the laboratory within 12 hours of the sampling time using Carpenter's (1965) modification of the Winkler method. The total sample is titrated with approximately 0.02 N sodium thiosulfate to the starch endpoint. Precision of the analyses is about  $\pm 0.06$  ml/liter (2 SD).

Nutrient Ions. At each station a 500 ml sample was filtered and quick frozen aboard ship and refrigerated at  $-10^{\circ}\text{C}$  until analyzed ashore within two weeks of collection. Groups of 43 samples were quick thawed in the laboratory just prior to the analyses for phosphate, nitrate, nitrite, ammonia, and silica. Standards and reagent blanks were prepared fresh daily and were determined with each set of samples. The standard and blanks were read before and after each set of samples. A linear drift correction was used to correct for electronic and chemical drift over the 20-minute reading time.

Dissolved reactive phosphate was determined by the methods of Murphy and Riley (1962) described in Strickland and Parsons (1972) using ascorbic acid to reduce the phospho-molybdate complex. The sample absorbance at 880 nm was determined with a 10 cm cell. Precision of the analyses is about  $\pm 0.03$   $\mu\text{g-at/l}$  (2 SD). Nitrate was determined by the cadmium-reduction method of Wood *et al.* (1967) followed by the nitrite color development. The sample absorbance was determined with a 1 cm cell. Precision of the analyses is about  $\pm 0.5$   $\mu\text{g-at/liter}$  (2 SD). Nitrite was determined by the method of Bendschneider and Robinson (1952) described by Strickland and Parsons (1972). The absorbance of the diazo color was determined with a 10 cm cell on the PC-1000 at 545 nm. The precision of the method

is about  $\pm 0.03$   $\mu\text{g-at/liter}$  (2 SD). Ammonia was determined by the Indophenol method of Solorzano (1969) with the color absorbance determined with a 10 cm cell on the PC-1000 at 650 nm. Precision of the method is about  $\pm 0.1$   $\mu\text{g-at/liter}$  (2 SD). Reactive silica was determined by the method of Mullin and Riley (1955) as modified by Strickland and Parsons (1972). The silicomolybdate complex was reduced by a metol-sulfite, oxalic acid solution, and the color absorbance at 810 nm was determined with a 1 cm cell on the PC-1000. Precision of the method is about  $\pm 1$   $\mu\text{g-at/liter}$  (SD).
